

Institutional structures and processes to support sepsis care: A multi-hospital study

Results from 51 Michigan hospitals from 12/2020-2/2022

Sepsis Treatment Domains Addressed in Hospital Documents/Guidelines

Hospital Self-Assessment of Peri-Discharge Practices

Summary of Findings

- Sepsis definitions & management recommendations were often incomplete.
- Minimal/no guidance on at least one component of sepsis care:
 - Antibiotics
 - Fluids
 - Vasopressors
- Few hospitals addressed peri-discharge practices

Standardizing sepsis structures & broadening processes to address peri-discharge care may aid in implementation of best practices
