

Risk Factors and Outcomes Associated with Community-Onset and Hospital-Acquired Co-infection in Patients Hospitalized with COVID-19

Patients hospitalized with COVID-19 from 3/2020-8/2020, across 38 Michigan hospitals

Co-infection Predictors

Community-onset Co-infection:

- Admission from long-term care facility
- Admission to ICU

Hospital-acquired Co-infection:

- Fever
- Advanced mechanical respiratory support

Future work should prospectively validate predictors of COVID-19 co-infection to facilitate antibiotic reduction
