

Contribution of Individual- and Neighborhood-level Social, Demographic, and Health Factors to COVID-19 Hospitalization Outcomes

Results from 38 Michigan hospitals participating in joint CQI effort from March-December 2020

Patients from most vulnerable neighborhoods:

- more severe COVID-19
- more intense treatment
- no difference in death or discharge to home

Conclusion: Policies that target socially vulnerable neighborhoods and access to COVID-19 care may help ameliorate health disparities
